

Telos Corporation manages and secures its electronic communications data with Somansa's Mail-i.

Headquartered Ashburn, Virginia, Telos Corporation has provided innovative IT solutions and services to the federal government for more than 30 years. Telos and Xacta Corporation, its subsidiary for security solutions, have since 1989 ensured that the government's most security-conscious organizations comply with demanding Defense information security mandates. Xacta offerings include enterprise IT security management solutions, enterprise security consulting services, secure networking, secure enterprise messaging, and secure identity management solutions.

As one of the largest U.S. federal government prime contractors, Telos Corporation main security concern was protecting corporate and customer data such as intellectual property, legal information, and customer account information from leakage. Telos Corporation also needed to meet requirements for regulatory compliance.

After evaluating several other solutions, Telos selected Somansa's Mail-i to manage and protect confidential company and customer information. "Here at the Telos Corporation, we use the Mail-i to easily capture outbound SMTP and web-based email, as well as instant messenger traffic," said Jeff Arey, Network Security Administrator for Telos Corporation. "Our main use is to easily search for emails when needed from this application, versus the hours this can sometimes take with our Exchange server. We can easily add users and access when needed for investigations."

Using Somansa's Mail-i, Telos protects its confidential company data including 560 employees and thousands of customer data. Mail-i secures the Telos Corporation's data by monitoring all outgoing electronic communication including corporate email, web-based email, instant messenger, FTP, and other protocols. According to Arey, "The other added benefit is the Mail-i traffic analysis engine alerts use to P2P traffic as well as other forms of unauthorized network applications. The Mail-i is stable, fast and has an easy to use graphical interface and search engine.

Telos Corporation began using the Somansa Mail-i on May 2006. The Mail-i is easy to deploy and use without any alteration to the existing network. With its agent-less based technology, the Mail-i monitors all electronic communication and attached files in a way that is unobtrusive with no effects to network performance.

Product:

- Mail-i

Mail-i Benefits:

- Protect confidential company information.
- Monitor network communication activity
- Comply with U.S. Federal and Industry regulations.

Why Mail-i?

- Easy to install and use with no effect to the network.
- Saves valuable company resources and time.
- Met all data security and compliance needs
